ABSTRACT:

PROBLEM TO BE SOLVED: To obtain the subject composition capable of raising the skin resilience of the excessively extended waist muscle and reducing body weight, and to provide a method for producing this composition.

SOLUTION: This pigment composition which is capable of raising the skin resilience of the waist muscle is obtained by mixing together various ingredients including calcium, potassium, iodine, selenium and alginic acid each extracted from wakame and/or tangle belonging to the genus Phaeophyceae (brown algae), sodium chloride to be added to these ingredients, and a viscous solution of inorganic silicic acid, aluminum and magnesium each afforded by

other. This composition has the following advantages other than that mentioned above: raising the waist flexibility, contributing to preventing skin aging through feeding the skin with various kinds of inorganic matter and minerals via capillary vessels communicating with the skin, and positively maintaining systemic balance, as well as affording the extended muscle at excessively fat belly site with resilience.
